

Module 6

Conditional Rendering

Conditional Rendering

- Conditional rendering allows components to display UI based on conditions or state value.
- This allows you to dynamically control what content is displayed to the user based on the state of your application.
- This can be done using several methods, such as JavaScript's conditional operators (if-else, ternary operator) or logical operators like `&&` and `||`.

using if-else statements to conditionally render components.

```
1 import React from 'react'
2
3 function UserGreeting(props) {
4
5     if(props.isLoggedIn){
6         return <h2>Welcome {props.username}</h2>
7     }
8
9     else{
10         return <h2>Please Log In</h2>
11     }
12 export default UserGreeting
```

```
1 import React from 'react'
2 import UserGreeting from './components/UserGreeting'
3
4 function App() {
5     return (
6         <div>
7             <UserGreeting isLoggedIn={true} username="Suhas S J"/>
8         </div>
9     )
10 }
11
12 export default App
```

Using Ternary Operator To Returning a variable

```
1  import React from 'react'
2
3  function UserGreeting(props) {
4      const welcomeMsg = <h2 className='welcome-msg'>
5          Welcome {props.username}
6          </h2>
7
8      const loginMsg=<h2 className='login-msg'>
9          Please Log In
10         </h2>
11
12         return (props.isLoggedin ? welcomeMsg : loginMsg)
13     }
14     export default UserGreeting
15
```

Using Logical && Operator

- The && operator can be used when you want to render something only if a condition is true.

```
1  import React from 'react';
2
3  function UserGreeting(props) {
4      return (
5          <div>
6              {props.isLoggedin && <h2>Welcome {props.username}</h2>}
7              {!props.isLoggedin && <h2>Please Log In</h2>}
8          </div>
9      );
10 }
11
12 export default UserGreeting;
13
```

Project

Password Toggle App

- Create a React application that allows users to show and hide their password using a button.
- The application should:
- Display a password input field
- Hide the password initially
- Show the password when the user clicks the “Show Password” button
- Hide the password again when the user clicks “Hide Password”
- Change the button text dynamically based on the current state

Login Logout Toggle App

- Create a React application that displays different components based on the login status of the user.
- The application should:
- Show a “Login” button initially
- Display the Home component when the user is logged out
- Display the Profile component when the user logs in
- Change the button text from “Login” to “Logout” dynamically
- Toggle between components using conditional rendering

Assignment

- Create and toggle button to show offline or online by clicking on button to user profile card
- Create login button show login/ logout when you click on button and show message based on login status as if login welcome user component and logout thank you user component should show

Interview Questions

- How to write conditions in react?
- Diff b/w && and ternary operator?
- What is ternary operator in react?
